Writing

Explaining technical specifications

Look at the picture and the technical information. Using the introduction of the JetLev-Flyer text on p.30 as a model, write a description.

Martin Jetpack

Maximum height for flying	2400 mm above the ground
Top speed	100 km/h
Range	50 km
Thrust	2670 newtons
Engine	Two-cycle – Martin Aircraft 2.0 litre
Safety features	harness, parachute
Empty weight	115 kg
Maximum pilot weight	130 kg

The JetLev-Flyer

The JetLev-Flyer can fly ten metres above water at a top speed of 35 kilometres per hour (9.75 metres per second) for 2–3 hours. This means the range of the Flyer is 70–105 kilometres. A powerful four-cycle engine produces 1900 newtons of thrust for stable, controlled flight.

The flight controls

All of the controls are onboard the jetpack. You control thrust by twisting the hand grip, as on a motorcycle. To move forward and accelerate, you push your arms down. To decelerate or reverse, you pull up. Or you can keep the water jet pointed straight down and hover, floating above the water in equilibrium. You can turn either by angling the water jets in different directions or by shifting your weight from side to side.

Safety features

You can fly it only over water, so that makes it safe to begin with – the water underneath you will usually allow a soft landing. It also has a five-point quick-release harness and good head and back support. Finally, the pack floats.

How it works

The jet propulsion medium is water, which means the jetpack uses a high-powered stream of water to create thrust. Water is supplied at high flow but low pressure to the jetpack by way of a ten-metre hose, which is attached to a boat that carries the motor and pump.

It will carry a pilot weighing up to 150 kilograms.

At the moment it is being marketed for water sports.
